Declaration

I, Your Name, roll number 12MS345, a student of the Department of Physical Sciences of the 5th Year BS-MS program of Indian Institute of Science Education and Research Kolkata, India, hereby declare that this thesis is my own work and, to the best of my knowledge, it neither contains materials previously published or written by any other person, nor has it been submitted for any degree/diploma or any other academic award anywhere before. I have used the originality checking service to prevent inappropriate copying.

I also declare that all copyrighted material incorporated into this thesis is in compliance with the Indian Copyright Act, 1957 (amended in 2012) and that I have received written permission from the copyright owners for my use of their work.

I hereby grant permission to Indian Institute of Science Education and Research Kolkata, India to store the thesis in a database which can be accessed by others.

Certificate

This is to certify that the thesis titled “Your Thesis Title Here” submitted by Your Name, a student of the Department of Physical Sciences of the 5th Year BS-MS program of Indian Institute of Science Education and Research Kolkata, India, is based upon his own research work under our supervision. We also certify, to the best of our knowledge, that neither the thesis nor any part of it has been submitted for any degree/diploma or any other academic award anywhere before.

Abstract

This thesis explores a novel approach to constructing a finite-dimensional holographic scalar field theory.

Introduction

This document serves as a comprehensive showcase of the features available in this thesis template. It demonstrates how to effectively utilize the custom environments, packages, and structural macros provided.

This is a margin note. It automatically fits the page margin.

I.1 Mathematics and Physics

The `IISERKphysics.sty` package automatically loads essential mathematical and physical typesetting tools. For example, you can seamlessly use the `physics` package for bra-ket notation and derivatives:

$$\hat{H} |\Psi\rangle = i\hbar \frac{\partial}{\partial t} |\Psi\rangle \quad (\text{I.1})$$

You can also easily define custom symbols for your nomenclature. For example, consider the speed of light c .

I.2 Theorem Environments

We have implemented beautifully styled theorem environments using `tcolorbox`. These are perfectly integrated with `cleveref`.

This is an inline todo note, useful for longer comments.

Theorem I.1. (No-Hair Theorem)

Stationary black holes are characterized entirely by mass M , charge Q , and angular momentum J .

Lemma I.2

This is a lemma without a title. Notice how the numbering follows the theorem counter.

Definition 1.3. (Event Horizon)

The boundary defining the region of space from which nothing can escape.

Remark 1.4. (Historical Note)

The term was popularized by John Wheeler in 1967.

As demonstrated, you can cross-reference these dynamically using `\cref{}`: [theorem 1.1](#) and [definition 1.3](#).

1.3 Code Listings

The template uses `minted` for professional, syntax-highlighted code blocks. Line numbers are rendered uncopyable so readers can easily copy the code.

```

1 import numpy as np
2
3 def calculate_energy(mass):
4     """Calculates rest energy  $E = mc^2$ """
5     c = 299792458 # m/s
6     return mass * c**2

```

Listing 1.1: A simple Python script demonstrating the `minted` configuration.

1.4 Figures and Tables

Floating environments are handled standardly, but their styling has been optimized for the template.

Figure 1.1: The official logo of IISER Kolkata.

Constant	Symbol	Value
Speed of light	c	2.99×10^8 m/s
Planck constant	h	6.62×10^{-34} J·s

Table 1.1: Example table of physical constants.

1.5 Citations

The template utilizes `biblatex` with the Biber backend. It is configured to automatically parse arXiv and DOI links. You can use standard citations (Hawking 1971) or text citations where the author's name becomes the clickable link, such as [Einstein \(1915\)](#).

2

Your Second Chapter Title

This is your second chapter. You can replace this text with your own content.

2.1 First Section

Add your section content here.

First Appendix

This is an example of an appendix chapter. Appendices automatically use alphabetic lettering (Appendix A, Appendix B) instead of standard numeric chapters.

A.1 Supplementary Information

You can include extra derivations, long tables of data, or additional code snippets here that are relevant but too detailed for the main text.
